

STOP & THINK

Week 1 – Spot the Risk

I'm rolling out a new initiative within the Engineering team to consider H&S on Friday mornings. It will take the form of various shapes from tips, articles, knowledge/experience sharing, quiz etc. It's intended to get you thinking for 5min on H&S and trigger thoughts on how you are developing your designs with due consideration to H&S.

Week One takes the form of 'Spot the Risk'. The linked photo was taken at a site whereby a section of a contact tank is being lifted into place. How many risks can you spot? There is no need to respond to this posting. The questions below are intended to get you thinking..

A question or two to get you thinking!

Where should the design team note the risk during the design stage ?

Who should the design team speak to during the design stage to discuss methodology of Construction?

Who in the design team should make a note of the risk during the design stage?

At what point in the design stage should the risk be considered?
